

Workspaces

Because we use our Macs for different reasons everyday.

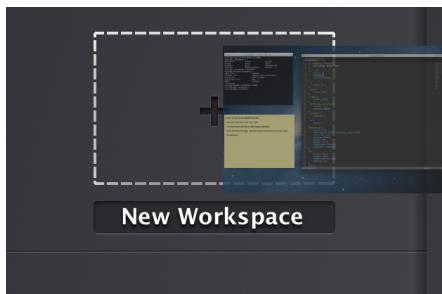

Workspaces lets users create, save, and reuse the perfect spaces for any situation.

The Workspaces tool resides in Exposé, and allows users to capture and save any visible application's window size and position on to a "Workspace." They can then restore that Workspace at any time. Workspaces will even capture the current state of the application, which could be a file, webpage, etc.

This will allow users to quickly switch to the right spaces and applications for the moment. For example, if a user is at work they might want to be in a "Productivity" workspace. They may want to have Numbers, Pages, and Mail open. However, once the user returns home they may want to switch to their "Entertainment" Workspace which might include the App Store, iTunes, and Messages. Workspaces enable the user to make transitions like these seamlessly, with one click.

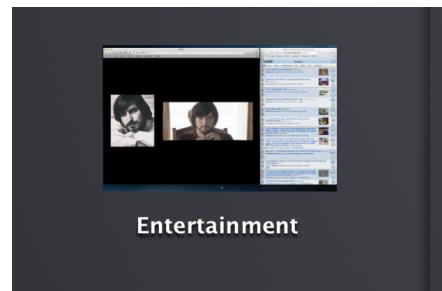

Creating a Workspace

Creating a Workspace is as simple as dragging a Space in Exposé to the upper-left corner of the screen and dropping it onto the new workspace container.

Once the user has created a Workspace, they can drop additional Spaces onto the Workspace before naming it.

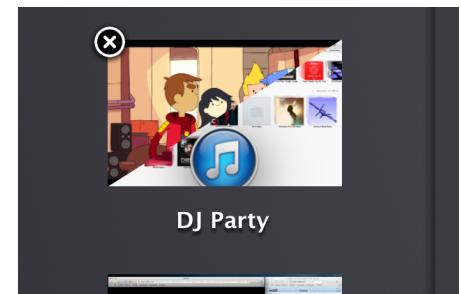

Launching a Workspace

To launch an existing Workspace, the user navigates to the left side of the screen in Exposé to reveal the Workspaces sidebar.

They can select any saved Workspace by clicking on it, which will launch the associated applications and arrange the windows as they were captured.

Removing a Workspace

Users can also delete workspaces they no longer wish to store.

By simply hovering their cursor over a saved Workspace the deletion cue will appear.
